Online E-Commerce Platform

GUVI Project Review | Java, JSP, JDBC, MySQL, Tomcat

Problem and solution

A role-based web application supports centralized product, user and order workflows.

Technology stack

Java 21; JSP/CSS; Jakarta Servlets; MySQL 8; JDBC; Apache Tomcat 10.1.

Architecture

Browser / JSP -> Jakarta Servlets -> DAO / JDBC -> MySQL database.

Database schema

users (primary key id); products (seller_id -> users.id); orders (buyer_id -> users.id; product_id -> products.id); wishlist (buyer_id, product_id); browsing_history (buyer_id, product_id).

OOP and Java evidence

Admin, Seller and Buyer extend User; roleDescription() demonstrates polymorphism; Dashboard interface; exceptions; List and ArrayList; LowStockMonitor implements Runnable; synchronized OrderDAO.place().

Database connectivity

DB.getConnection(), UserDAO, ProductDAO, OrderDAO, PreparedStatement, ResultSet, commit and rollback.

UI/UX screenshots

INSERT REAL SCREENSHOTS: login page, Admin dashboard, Seller dashboard, Buyer catalog and orders. Screenshots have not been captured or verified in this document.

Review conclusion

The source demonstrates the requested stack and code constructs. Full runtime and responsive testing remain the student’s responsibility.
